# About Data Treehouse

Data Treehouse is a Norwegian technology company building high-performance knowledge graph tooling on open standards. Our core product maplib is a Rust-powered Python framework that brings the speed and interactivity of DataFrames to RDF knowledge graphs. Built on Polars, Apache Arrow, and Rust, maplib holds published benchmarks for the world's fastest SHACL engine and delivers 10-85x faster federated time-series queries than the nearest competitor. We work with clients across energy, rail, public administration, defence, and more.

We are a small, technically strong team with direct impact on both the product and client outcomes. We are growing and looking for two new team members.

# 1. Systems Developer

## About the role

We are looking for a systems developer to work on the core technology at Data Treehouse. You will be building and improving the engine that powers maplib, from storage and query execution to reasoning and inference. This is deep technical work on a high-performance system.

## What you will do

- Design and implement core components of maplib in Rust
- Work on database technologies: storage, indexing, query planning, and execution
- Develop and optimise data processing pipelines using Polars and Arrow
- Implement logic-based reasoning and inference engines
- Contribute to NLP-related features and integrations
- Write Python bindings and APIs for the Rust core

## What we are looking for

- Strong experience with Rust
- Knowledge of database systems
- Experience with Polars, Apache Arrow, or similar columnar data frameworks
- Python proficiency
- Experience with logic programming, reasoning and inference.
- Familiarity with NLP concepts and tooling
- You enjoy working on hard technical problems at the systems level

# 2. Senior Knowledge Engineer

## About the role

We are looking for a senior hands-on developer to work directly with our clients, building knowledge graph solutions using maplib and the semantic technology stack. You will take ownership of client projects, understand their data and domain, and deliver working solutions.

## What you will do

- Build knowledge graph solutions with clients using maplib, OTTR, SPARQL
- Work with DataFrames and data pipelines in Python and Polars
- Model domains using RDF, OWL, SHACL, and related standards
- Validate, enrich, and reason over knowledge graph
- Communicate directly with clients to understand their needs and deliver results
- Work independently on technical delivery while staying aligned with the team

## What we are looking for

- Strong Python skills with hands-on experience with DataFrames and Polars
- Experience with the W3C Semantic Technologies
- Knowledge of, or experience with, Datalog
- Comfortable working directly with clients across different domains
- Independent and self-driven, with strong communication skills
- Experience with data engineering, data modeling, or semantic technologies
- You enjoy getting into new domains quickly and delivering working solutions

# What we offer

- Permanent employment in a small company with broad technical scope
- Hybrid/remote work
- The opportunity to work with cutting-edge technology in knowledge graphs and high-performance data systems
- Direct impact on product development and client delivery
- A collaborative team grounded in research and engineering excellence

# Application

Send a ***short application*** and your ***CV*** to info@data-treehouse.com
You can meet our representative Veronika Heimsbakk at ISWC in Bari.
Tell us which role interests you, and feel free to share projects or experience relevant to the position.
